

Jay Coughlan

250-508-7413 – JayCoughlan@protonmail.com – JayAKCoughlan.com – Cobble Hill, BC, Canada

> Professional Summary

Jay is a Software developer and Customer Support Specialist with 7+ years of experience working in a Software as a Service environment, investigating and resolving technical issues with enthusiasm. He communicates exceptionally well across multi-disciplinary teams and works with peers to write clean, high-quality code with unit tests for deploy to live service products. He is always eager to take on new opportunities to expand his horizons.

> Technical Skills:

- **Programming Languages** – C++, PHP, C#, Python, Javascript, HTML + CSS, React
- **Technical Tools** – Unity, Git, GitHub, Jira, Confluence, Windows Powershell, Visual Studio Code

> Professional Experience:

> Fenris Publishing (*May 2022 – Current*)

Gameplay Developer (2022 – Current)

- Built, developed, and tested gameplay mechanics (including player controls, enemy AI, environment, and menu UI) as a part of a four-person team. Managed development tasks alongside full-time work.
- See below *Projects: Neon Roar*

> Checkfront (*March 2018 – January 2026*)

Software Developer (2024 – 2026)

- Worked as part of a multi-functional, agile team, providing and receiving feedback in code reviews to ensure high quality, testable, and modular code deployed to live customers within product lead deadlines

Technical Support Analyst Lead (2022 – 2024)

- Managed technical analyst team by organizing daily schedules and tasks for 3 team members, running team meetings, and unblocking issues while maintaining an average team customer satisfaction of over 92%

QA Automation Developer (2021 – 2022)

- Tested incoming code changes for issues by using my customer service skills to find creative edge cases and provide detailed feedback on how to reproduce found issues to support an excellent user experience

Technical Support Analyst (2018 – 2021)

- Worked with development and product teams to resolve advanced technical questions while maintaining a 95% positive Customer Satisfaction score

> Projects:

> Neon Roar (*Fenris Publishing*)

A retro-style video game based on favorite, popular titles from the Sega Saturn. Play as one of four characters each with a different gameplay style in a Neon-Punk, 80's horror style world.

- Built using Unity 5 and C#
- Worked asynchronously with a team of creators, including other developers, artists, and project leads in my own time
- Planned shipping to PC, Switch, xBox, and Playstation

> Website Theme (*Furry Writers' Guild*)

A website theme built around the Furry Writers Guild's needs to display their style. Theme was built for the Ghost platform.

- Built with HTML, CSS, and Javascript for the Ghost blogging platform
- Worked as an individual on the project outside of work hours
- Gathered business requirements from stakeholders and translated into technical tasks

> Support Stakeholder Notify Script (*Checkfront*)

Technical Support Analysts need to follow up on all Zendesk tickets attached to a deployed bug fix. The goal of this project was to automate re-opening the Zendesk tickets, saving time and reducing busy work.

- Identified a bottleneck within support processes and developed internal tool to automate processes using PHP
- Automatically re-open and apply a generic internal message to all tickets, assign tickets to last agent, and only follow up once if operator reached out multiple times
- Two-Month project between other support responsibilities

> Zephyr Sprint Setup Tool (*Checkfront*)

The QA team needs to transfer all new and carry over Jira tickets into Zephyr between sprints. The goal of this project was to automate the process for each team, saving time and reducing busy work

- A PHP tool to scan Jira for each new sprint, add new tickets to Zephyr, and transition existing tickets to the new Zephyr sprint
- Run manually by QA agent at the start of each sprint
- Two-month project between other QA responsibilities

> Cave Flier (*B.C.I.T.*)

Our Mid-Term project at B.C.I.T. was a short game experience developed as a team. Our goal was to build an algorithmically generated first-person flight simulation game with potentially infinite levels for mobile devices.

- Part of a four-programmer team with a Three-week production cycle
- First person flight game with randomly generated obstacles and consumables
- Used C# and Unity3D
- Used GoogleVR

> Password Updater Script (*Absolute Software*)

In hosting Ops we needed to change the default password of every new PC we purchased for security. The goal was to generate a custom password, changed it on the device, and saved it in PasswordState.

- Coded internal tools for Absolute Software
- Used Powershell, the Powershell markup language, and PasswordState API's
- Three-month project in between other responsibilities
- Created script to automate and manage checking password ages and generating new passwords

> Moon Child Game (*Vancouver Film School*)

Our final project at Vancouver Film School was a short game experience developed as a team. Our goal was to build a third-person platformer with two levels, voice acting, and enemy AI.

- Worked as the sole programmer on five-person team using Unity 3 and C#
- Third person platformer with traditional and runner mechanics
- Dedicated four-month production cycle

> Education:

> B.C.I.T. (Jan. 2014 – May 2017)

- Diploma for Computer Systems Technology

> Vancouver Film School (Oct. 2011 – Oct. 2012)

- Diploma for Video Game Design

> Hobbies and Interests:

Dragons, video games (PC and Nintendo), fantasy novels, fantasy novels about dragons, Pokémon, drawing, dungeons and dragons, and not being killed by dragons in dungeons and dragons.
